

**ONE TOUCH  
TIME OUT  
REPROGRAMMING**

## **Control Module Time-Out Reprogramming**

1. Press the small button and large right button (close) at the same time for approximately 10 seconds. Pressing these buttons at the same time will cause the module to enter the time out programming mode. After entering programming mode, the led will flash and the number of flashes represents the timing cycle it is in per the following table.

LED Flash	Timing cycle before auto shutdown
1	On Indefinitely
2	2 minute on time
3	4 minute on time
4	6 minute on time
5	8 minute on time
6	10 minute on time

2. To increase the flashes press the left large button (open) and to decrease the flashes press the large right button (close). The LED will flash after pressing one of the buttons to represent the new timing cycle. The unit times out of programming mode after 10 seconds of no activity.

The above instructions only apply to Rev14 RF modules (the rev number is located on the inside surface of the module). Prior to this, the modules were not programmable.
